

1. Gravitational Potential Energy

The 0.50 kg sphere to the right is immersed in a gravitational field created by a planet with a mass of 2.0×10^{20} kg and a radius of 3.0×10^4 m.

a. What is the strength of the field at the surface of the planet?

$$g = GM/R^2 = \frac{6.67 \times 10^{-11} \text{ Nm}^2/\text{kg}^2 \cdot 2 \times 10^{20} \text{ kg}}{(3 \times 10^4 \text{ m})^2}$$

$$g = 14.8 \text{ N/kg}$$

b. How much force must be exerted to lift the mass (i.e. what is the weight of the mass)?

$$F = mg = 0.5 \text{ kg} \cdot 14.8 \text{ N/kg} = 7.4 \text{ N}$$

c. How much work must be done to raise the mass 3.0 m above the surface?

$$W = F \cdot d = 7.4 \text{ N} \cdot 3 \text{ m} = 22.2 \text{ J}$$

d. How much gravitational potential energy does the sphere have when it's 3.0 m above the surface?

$$PE = W = 22.2 \text{ J}$$

e. If the sphere were dropped, how much kinetic energy would it have right before it hit the surface?

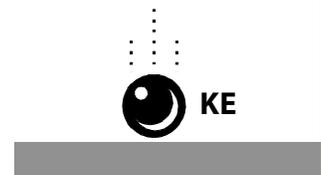

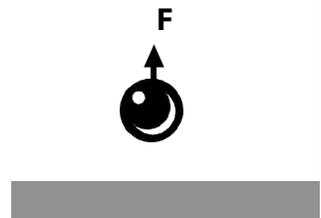

$$KE_{\text{bottom}} = PE_{\text{top}} = 22.2 \text{ J}$$

f. How fast would it be moving right before it hit?

$$KE = \frac{1}{2}mv^2 \therefore v = \sqrt{2KE/m}$$

$$v = \sqrt{2 \cdot 22.2 \text{ J} / 0.5 \text{ kg}}$$

$$v = 9.4 \text{ m/s}$$

2. Electric Potential Energy

The sphere to the right has a charge of 50 nC and is immersed in an electric field created by two charged circular plates. The charge on each plate is 20 μC (top +, bottom -) and each plate's radius is 15 cm.

a. What is the strength of the field between the plates?

$$\begin{aligned} E &= 4 \text{ kQ/A} = 4 \text{ kQ/} r^2 = 4\text{kQ}/r^2 \\ &= 4 \cdot 9 \times 10^9 \text{ Nm}^2/\text{kg}^2 \cdot 20 \times 10^{-6} \text{ C} \\ &= 3.2 \times 10^7 \text{ N/C} = 32 \text{ MN/C} \end{aligned}$$

b. How much force must be exerted to lift the charge?

$$\begin{aligned} F &= qE = 50 \times 10^{-9} \text{ C} \cdot 32 \times 10^6 \text{ N/C} \\ F &= 1.6 \text{ N} \end{aligned}$$

c. How much work must be done to raise the charge 2 cm away from the negative plate?

$$\begin{aligned} W &= F \cdot d = 1.6 \text{ N} \cdot 0.02 \text{ m} \\ W &= 0.032 \text{ J} = 32 \text{ mJ} \end{aligned}$$

d. How much electric potential energy does the sphere have when it's 2 cm away from the negative plate?

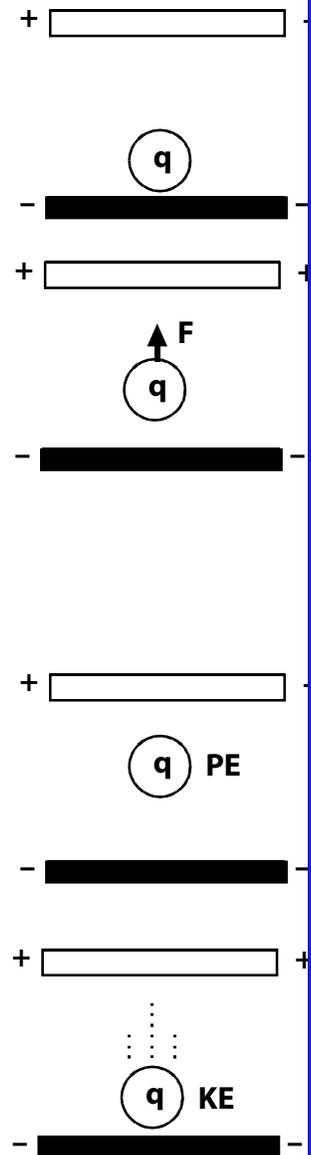

$$PE = W = 0.032 \text{ J}$$

e. If the charge were released, how much kinetic energy would it have right before it hit the negative plate?

$$KE_{neg} = PE_{pos} = 0.032 \text{ J}$$

f. If the sphere had a mass of 1.0 g, how fast would it be moving right before it hit? (Neglect gravity.)

$$\begin{aligned} KE &= \frac{1}{2}mv^2 \therefore v = \sqrt{2KE/m} \\ v &= \sqrt{2 \cdot 0.032 \text{ J} / 0.001 \text{ kg}} \\ v &= 8.0 \text{ m/s} \end{aligned}$$
